

FLEXCLOSE TB300

Technical information - FlexClose

The Cimbria Moduflex loading chutes type C300, S300, F300 and K300 can be equipped with a FlexClose which is opened and closed as an integrated part of the lifting and lowering function.

The FlexClose can only be used for outlet type T for tanker truck with round tanker inlet.

The FlexClose has two main functions:

1. The loading chute is always sealed off when disconnected from the material recipient. This prevents unwanted objects, such as birds or insects, from entering the loading chute. This function also reduces the absorption of moisture from the air by hygroscopic products.
2. As the loading chute is closed whenever disconnected from the material recipient, waste and spillage is considerably reduced meaning less time and resources used for washing and cleaning of both vehicles and the surroundings.
