

Connecting Boxes and Adapters

TYPE Q-24

Connecting boxes

Connecting boxes type TM and TN (also known as T-pieces) are used where two spouts join together. Type TM is used for the connection of two sloping spouts with a dip angle of 38°, but can also be delivered with a dip angle of 55°. Type TN can be used in the two positions shown below: for connection of a vertical and a sloping spout in A: one vertical spout or B: one sloping spout.

In a third position a connection box type TN built together with a shutter type SK can be used as a grain brake to soften the fall effect from a long vertical spout line.

TM 755

TN 7

TN 755

Adapters

Adapters are used to change from one Q-size to another and are manufactured symmetrical and asymmetrical.

Asymmetrical adapters are specially designed to be used when changing Q-size on angled spout runs, enabling the underside of the spout to remain level.
